

The certWin Client provides all certificates and private keys of a user on any computer in a domain where the user is logged in. This is done by synchronizing the local Personal Windows Certificate Store with the central key archive in the TOPKI certificate database. The complete certificate / key history is imported into the user's certificate store using the certLife REST API. This takes into account whether the respective certificate already exists in the certificate store. certWin Client provides the following features:

- Recovery of a user's key history using certLife REST API
- Service authorization for a user based on integrated Windows Authentication
- Import of all missing certificates and private keys into the Windows Certificate Store
- Provisioning of all certificates and keys to all computers where the user is logged in
- Usability of central key generation using certLife autoenrollment
- Automated execution during logon possible

#### Operating Systems:

- Windows 10
- Windows Server 2016
- Windows Server 2019

#### SW Requirements:

- .NET Framework 4.5

#### Standards:

- X.509 certificates RFC 5280
- PKCS#12

#### Server:

- Secardeo certLife Enterprise Edition v1.6.
- REST API configured
